

Your brand. Your students. One workspace.

A mature operating system for trading educators and signal providers to manage courses, students, practice, journals, payments, support, and controlled signal readiness in one place.

Built for educators who want a serious workspace, not another scattered tool stack.

Pitch deck for trading educators, communities, and signal providers

Trading education is too scattered

Most educators do not lose time because they lack content. They lose time because the business runs across disconnected apps.

- Telegram or WhatsApp for signals and student questions.
- A separate course tool for lessons and progress.
- Spreadsheets for journals, practice, payments, and support notes.
- Manual reminders, manual follow up, and unclear student readiness.
- No single source of truth for who paid, learned, practiced, and needs help.

One controlled workspace for the education business

TradeHub brings the operational pieces together while keeping high risk execution paths gated, visible, and reviewable.

Courses

Structured lessons, resources, checks, notes, bookmarks, and proof of completion.

Practice

Replay, simulated orders, reports, challenge rules, assignments, and feedback.

Journal

Manual trades, practice outcomes, analytics, calendar, import, and export.

Operations

Student CRM, payment readiness, support actions, admin review, and safe alerts.

A focused student experience

Students see the work they need to do without being exposed to internal admin records or risky execution controls.

- Courses with progress, checks, private notes, bookmarks, resources, and proof.
- Practice terminal with replay, indicators, events, simulated orders, and reports.
- Manual journal with trade review charts, analytics, calendar, import, and export.
- Assignments, feedback, reminders, and task inbox for accountability.

Operations without private leakage

The workspace is designed for running the business, not exposing raw student records.

- Student CRM lifecycle states, readiness counts, safe support notes, and billing indicators.
- Course authoring, lesson ordering, resources, deterministic checks, and completion visibility.
- Practice assignments, cohorts, scheduling, review queue, rubric feedback, and resubmissions.
- Aggregate only insights for practice, course progress, payments, and support readiness.

Backtesting without live execution

The practice module helps students rehearse decisions and review outcomes before risk moves into real accounts.

- Revealed candle replay with no future candle exposure.
- Simulated market, limit, and stop orders with conservative fills.
- Instrument aware sizing, indicators, event markers, drawings, notes, and bookmarks.
- Session reports, challenge rules, instructor review, and workspace assignments.

Manual trade review and performance clarity

The journal is for a student who wants to check a trade, understand what happened, and track patterns over time.

- Manual trade create, edit, archive, and private notes.
- Trade review chart with entry, exit, stop loss, take profit, and candle context.
- Analytics for win rate, net PnL, R multiple, expectancy, profit factor, symbols, strategies, tags, emotions, and mistakes.
- Safe import, export, and JSON backup owned by the signed in student.

Signal workflows with controlled boundaries

TradeHub can support signal workflows and controlled readiness checks while keeping live execution separate from normal workspace features.

- External signal ingestion is preview only until reviewed and approved.
- Signal previews are not student visible and not executable by default.
- AutoCopy readiness is gated by payment, consent, vault, kill switches, preflight, and reconciliation.
- Trade Copier is a separate optional add on, not bundled into core workspace packages.

Support, payments, and incident visibility

The admin layer helps operators see what is blocked, what needs review, and what must stay off.

- Payment and subscription support queue with masked refs.
- Dry run messaging and reminder readiness with consent and suppression gates.
- Incident, rollback, reconciliation, and live AutoCopy readiness panels.
- Deny by default browser rules for protected operational, journal, practice, messaging, and signal data.

Packages exist. Pricing is by conversation.

TradeHub packages are quoted privately because final terms depend on student capacity, support depth, integrations, hosting profile, and rollout requirements.

The public deck shows what each package contains. The commercial offer is shared after fit review.

Launch Workspace

Starter capacity, up to 50 active students

- Student app, courses, practice terminal, manual journal, and reports.
- Basic workspace dashboard, student CRM, payment visibility, assignments, and feedback.
- Best for one educator or a focused trading community.
- Trade Copier is not included by default.

Pro Workspace

Growth capacity, up to 500 active students

- Everything in Launch.
- Advanced cohorts, assignment scheduling, review queue, resubmissions, workspace insights, analytics, import, and export.
- Priority onboarding and stronger operations workflows.
- Trade Copier remains a separate optional add on.

Enterprise Workspace

Custom capacity and custom agreement

- Everything in Pro.
- Negotiated onboarding, support, branding, reporting, integrations, infrastructure planning, and service terms.
- Built for larger academies, teams, or partners with custom requirements.
- Trade Copier can be discussed separately if the rollout is approved.

Extra services stay separate

Keeping add ons separate protects margin, keeps the base workspace clean, and avoids promising expensive provider costs before demand is proven.

- Trade Copier add on: separate paid service for eligible students only.
- Forex and CFD historical provider setup: optional real data provider configuration.
- Custom onboarding: workspace setup, training, and migration support.
- Custom reports, white label polish, dedicated support, and integration planning.

Why the price is not public

TradeHub is closer to an operating system than a simple course website. The right commercial model depends on the educator's student volume, support expectations, and infrastructure footprint.

- Small workspaces need a clear launch package and predictable support boundaries.
- Growing academies need capacity, analytics, cohort operations, and faster support.
- Enterprise buyers need negotiated capacity, infrastructure, branding, integrations, and service terms.
- Trade Copier has provider and operational costs, so it is quoted and billed separately.

The core foundations are built

TradeHub has moved beyond a concept deck. The current build has frozen foundations across the major product areas.

- Practice and backtesting MVP with terminal, reports, assignments, feedback, import, export, analytics, and event markers.
- Course and lesson MVP with checks, progress, resources, notes, bookmarks, proof, and search.
- Workspace ops, student CRM, payment support, dry run reminders, manual journal, and external signal preview.
- Controlled live AutoCopy support, readiness, cohort dry run, incident, rollback, and acceptance gates.

Sell the operating system, not cheap access

TradeHub should be positioned as infrastructure for serious trading educators: a branded workspace that helps students learn, practice, journal, and receive structured support.

- The buyer is paying for a working education business system.
- Pricing should protect support time, infrastructure cost, provider cost, and future maintenance.
- Core packages should stay clean and understandable.
- Riskier or cost-heavy features should remain optional add-ons until demand is proven.

Bring your education business home.

One workspace for students, lessons, practice, journal clarity, support operations, and controlled signal readiness.

Packages are available. Pricing is shared after a fit review.
